Summary for Decision Makers

MILLENNIUM ECOSYSTEM ASSESSMENT

Some important challenges in ecology

*(2) At multiple scales: **Apply knowledge** from one scale, site or time period to another*

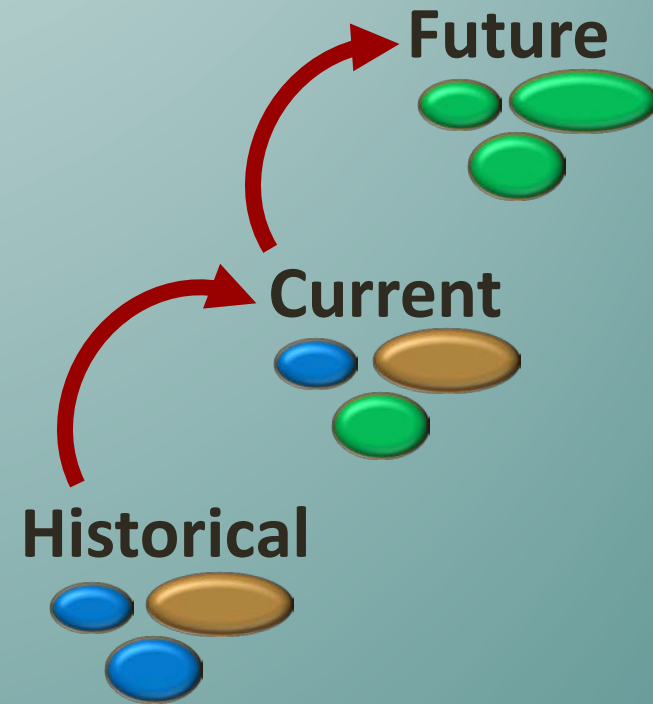

Extrapolation

Scaling up

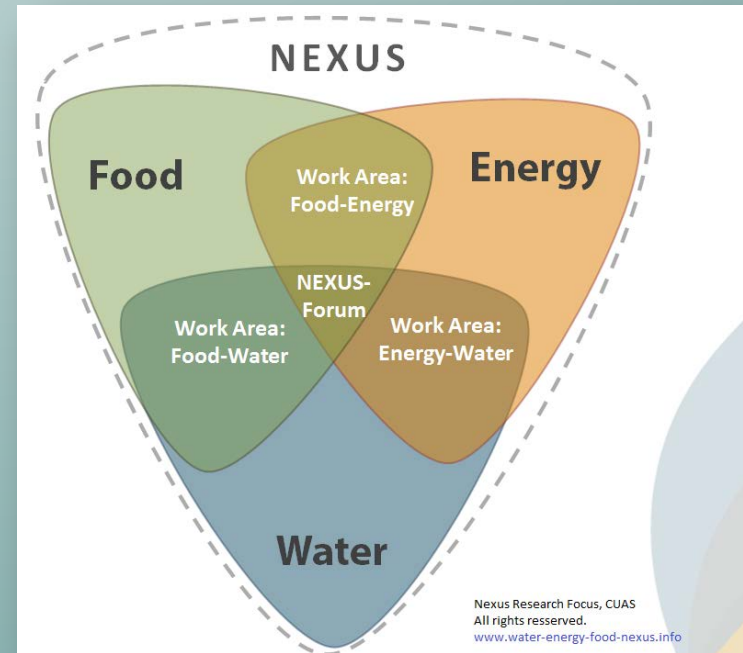

Forecasting

Some important challenges in ecology

(3) At more local scales – The role of ecological processes at interface of disciplines: Socio-ecol. systems; FEW-Nexus

Addressing these challenges will require research that is:

1. Conducted in **teams** of individuals with different expertise and sometimes disciplines
2. **Data-intensive** to help to address MANY of the challenges
3. Based on **sharing of data, models, and code**

BUT, the past norms and practices of ecology include...

1. The dominance of single-investigator science
2. Research efforts that are mostly data-limited (*i.e., good data, but not enough of it!*)
3. Data that are, for the most part, not shared outside of research teams

OVERVIEW: The new norms are...

1. Science is increasingly conducted by teams
2. Data-intensive research is on the rise
3. Data sharing is needed for emerging research areas

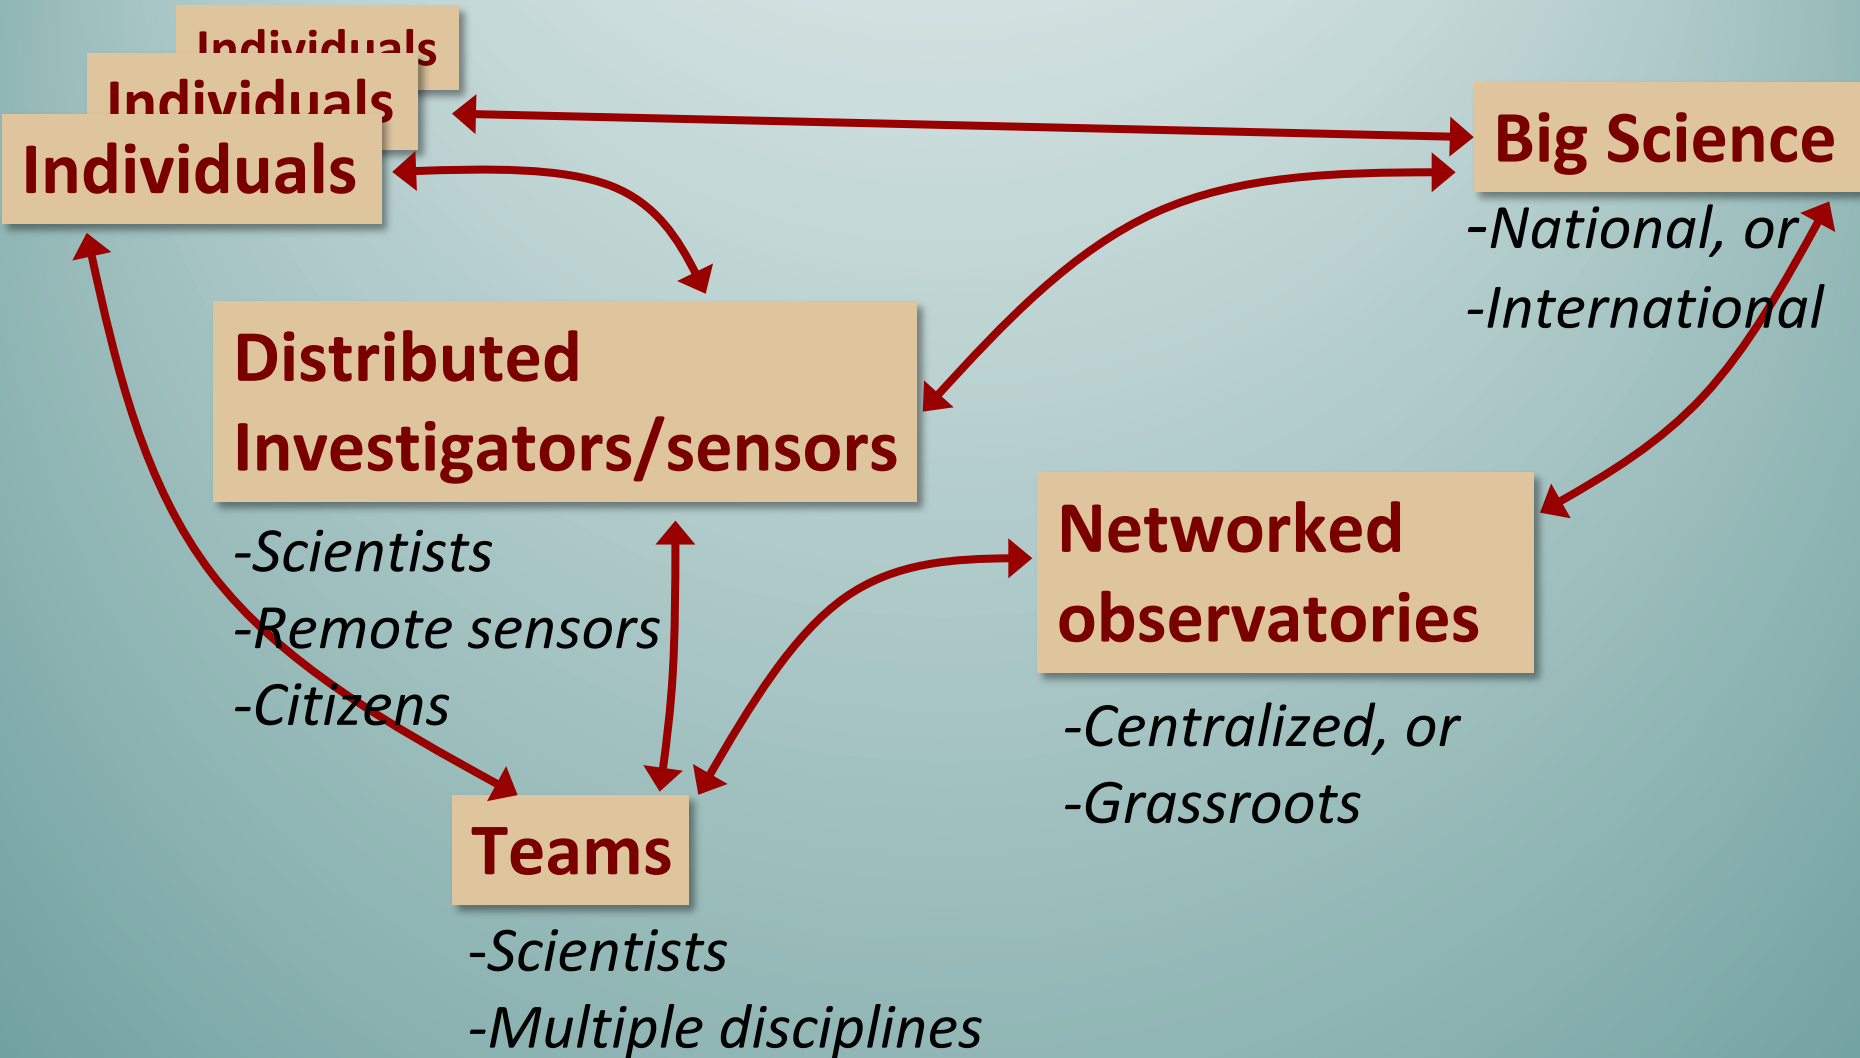

For each, lets consider the:

- *Context*
- *Resistance to adopting new practices related to the norms*
- *Recommendations for moving forward*

OVERVIEW: The new norms are...

- 1. Science is increasingly conducted by teams**
- 2. Data-intensive research is on the rise**
- 3. Data sharing is needed for emerging research areas**

Science is predominantly conducted by teams

What makes an effective & productive team?

KS Cheruvilil

PA Soranno

KC Weathers

PC Hanson

SJ Goring

CT Filstrup

EK Read

What makes an effective & productive team?

What is related to group 'collective intelligence'?

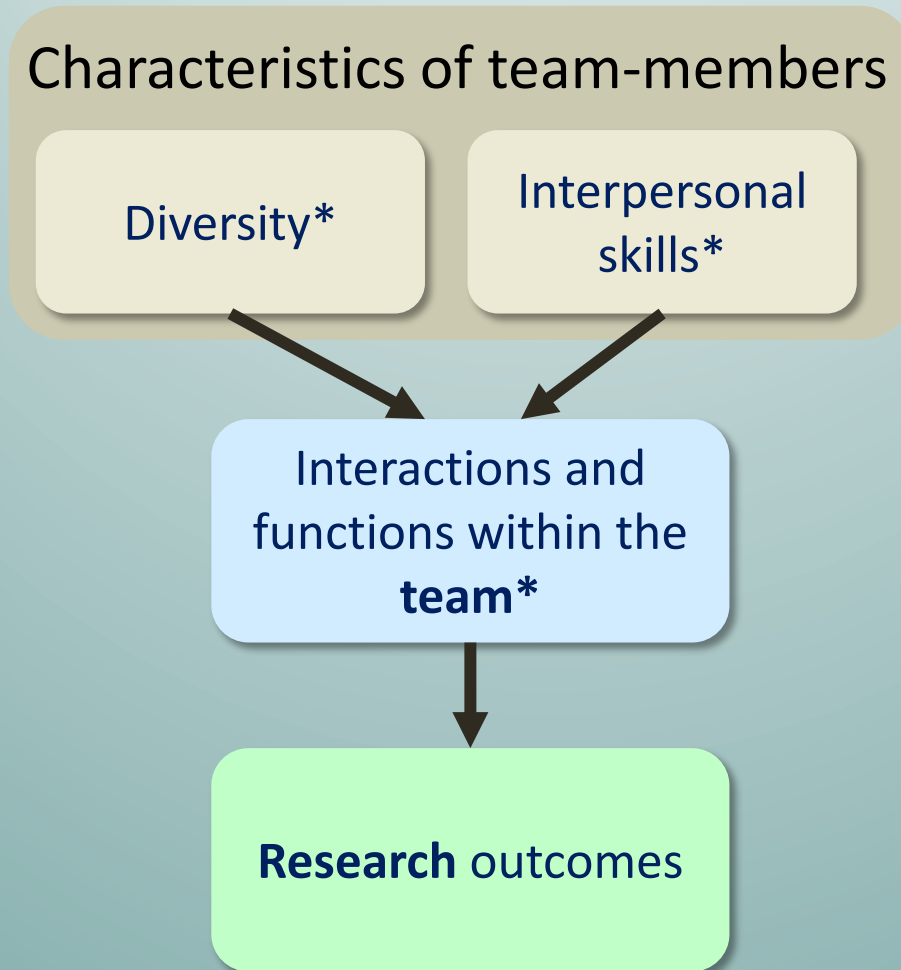

Woolley et al. 2010. *Science*

“Collective intelligence” of groups is NOT strongly correlated with the average or maximum individual intelligence of members.

It is correlated with the average ‘social sensitivity’ of group members – i.e., equality in distribution of speaking turn-taking

* AND, it works for face-to-face AND virtual teams!

What makes an effective & productive team?

** Each item supported by research on teams*

What makes an effective & productive team?

February 2016

QUARTZ

IMAGINE THAT

After years of intensive analysis, Google discovers the key to good teamwork is being nice

What makes an effective & productive team?

In total, there were five dynamics the researchers found to be significant for team effectiveness:

1. **Psychological safety:** Can we take risks on this team without feeling insecure or embarrassed?
2. **Dependability:** Can we count on each other to do high quality work on time?
3. **Structure & clarity:** Are goals, roles, and execution plans on our team clear?
4. **Meaning of work:** Are we working on something that is personally important for each of us?
5. **Impact of work:** Do we fundamentally believe that the work we're doing matters?

<https://rework.withgoogle.com/blog/new-guide-and-tools-understand-team-effectiveness/>

What makes an effective & productive team?

- Social sensitivity
- Emotional engagement
- Trust

4. Team communication⁵

Evenness of talking and listening;
lack of dominance

Equal interaction among members
in communication, body
language, and tone

⁵Johnson and Johnson (1991); Stokols
et al. (2008b); Woolley *et al.* (2010);
Pentland (2012)

How can you make and keep great teams?

How can you make and keep great teams?

Exercises and discussions to:

- *Appreciate & understand **team heterogeneity***
- *Build **social sensitivity***
- *Work on **team functioning***
- *Develop **written team policies***

I don't do touchy-feely stuff like that.

Are you serious?

I am NOT doing that.

Better science outcomes

Scientists aren't like other people.
We are different.

Students are very comfortable
talking to me; they can knock
on my door any time.

“These days, scientists spend much of their time taking ‘professional selfies’—effectively spending more time announcing ideas than formulating them.”

August 2016

Science in the age of selfies

Professor of
Applied Math,
Johns Hopkins
Univ.

James Manning
Professor of
Applied Math,
Brown Univ.

Donald Geman, and Stuart Geman PNAS 2016;113:9384-9387

Arguments AGAINST new science norms

In fact, maybe it has become too easy to collaborate.

Great ideas rarely come from teams.

There is, of course, a role for “big science” (the Apollo program, the Human Genome Project, CERN’s Large Hadron Collider), **but teamwork cannot supplant individual ideas.**

Science of the past 50 years seems to be **more defined by big projects than by big ideas.**

In a 2014 letter to *The Guardian* newspaper, 30 scientists, concerned about today’s scientific culture, noted that **it was the work of mavericks like Feynman that defined 20th century science.**

* MAVERICK = An unorthodox or independent-minded person.

Donald
Geman, and
Stuart
Geman PNAS
2016

Arguments AGAINST new science norms

SOLUTION:

Spend more time on each project, be less inclined to join large teams in small roles, and spend less time taking professional selfies. Perhaps we can then **return to a culture of great ideas and great discoveries.**

**Donald
Geman, and
Stuart
Geman PNAS
2016**

But, what do the numbers say???

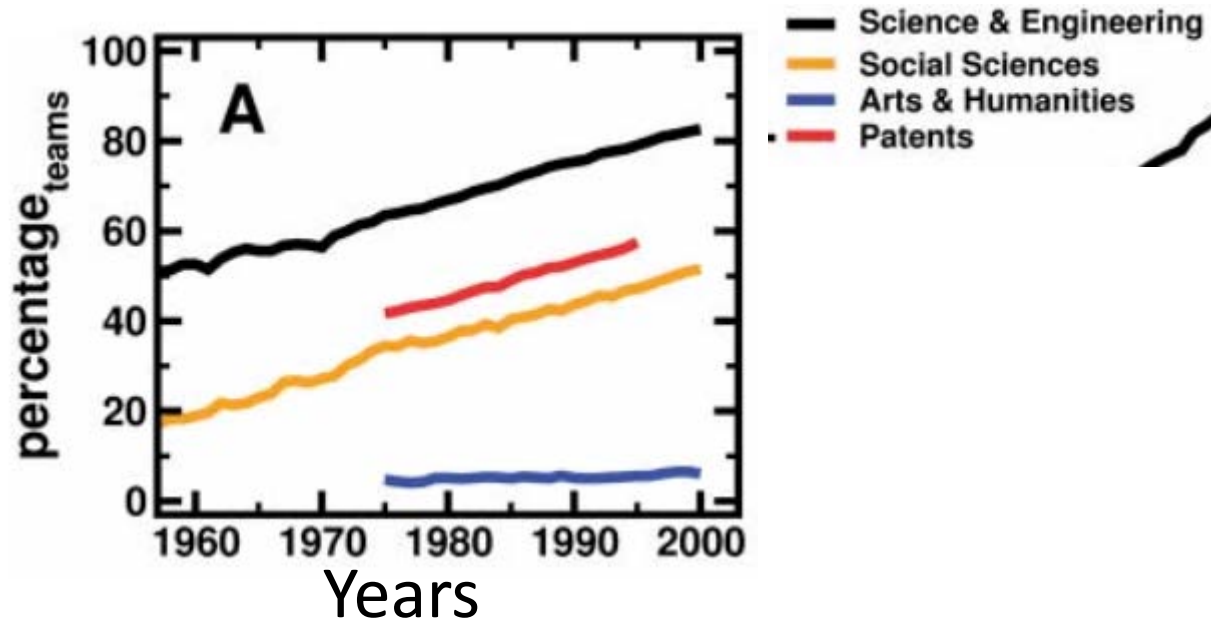

Wuchty et al. 2007. Science

Tested the 'lone genius (maverick??)' hypothesis

- 19 million articles, 2 million patents, 50 yrs

% of papers written by teams is increasing

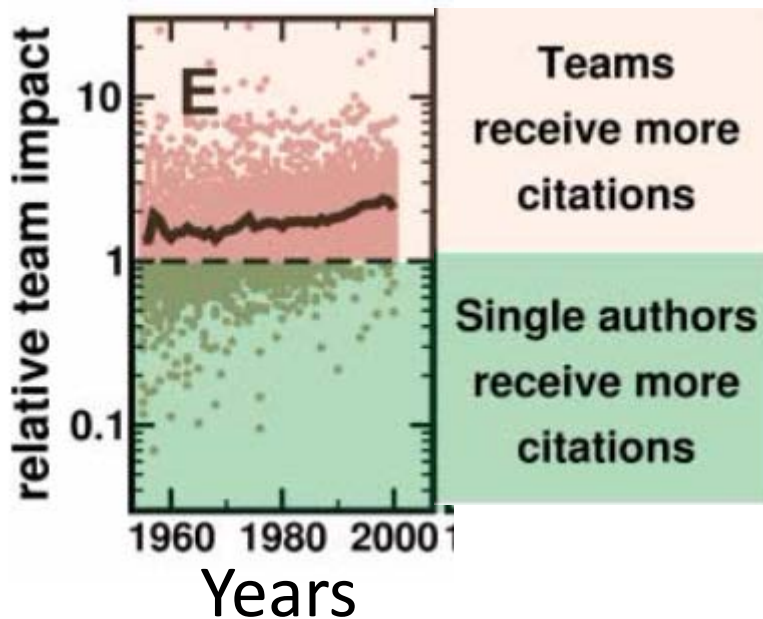

But, what do the numbers say???

Wuchty et al. 2007. Science

Tested the 'lone genius (maverick??)' hypothesis

Team papers are/have been cited at a higher rate compared to single-author papers Science & Engin.

- Also happens in math, economics, sociology

Recommendations: Team Science

- **Training in collaboration**
 - Practices for true inclusion
 - Constructive & effective conflict resolution
 - Communication skills
 - Practices for maximizing creativity
- **Develop best-practices for your teams**
 - Copy what works, and share

<http://www.scienceofteams.org/>

The new norms are...

1. Science is increasingly conducted by teams
- 2. Data-intensive research is on the rise**
3. Data sharing is needed for emerging research areas

Data-intensive science - *Defined*

Research in which the capture, curation, and analysis of large volumes of data are central to the scientific question.

OR...research that uses datasets so large or complex they are hard to analyze using traditional methods

The Opinion Pages | OP-ED CONTRIBUTORS

Eight (No, Nine!) Problems With Big Data

By GARY MARCUS and ERNEST DAVIS APRIL 6, 2014

*Professor of
Psychology, NYU*

*Professor of Computer
Science, NYU*

Data-intensive science - *PROBLEMS*

- **Atheoretical**, only data-driven
- **Biased**
- **Multiple comparisons** problem
- **Expertise** missing
- Issues with using **other people's data**

Historical perspective – *Debate over hypo-driven rsch*

1600's

Hypotheses

Inductive reasoning

“Investigators could be easily led astray if they **proposed bold conjectures** rather than working inductively from the available evidence.”

- **Newton**

Conceptions of good science in our data-rich world

Kevin
Elliott,
Philosopher

Kendra
Cheruvilil,
Ecologist

Georgina
Montgomery,
Historian

Patricia
Soranno,
Ecologist

Historical context of hypothesis-driven science

Hypothesis-driven approaches:

Boyle and Hooke advocate for hypothesis-driven approaches

Dominance of hypothesis-driven approach (e.g., Popper)

Criticisms of descriptive science

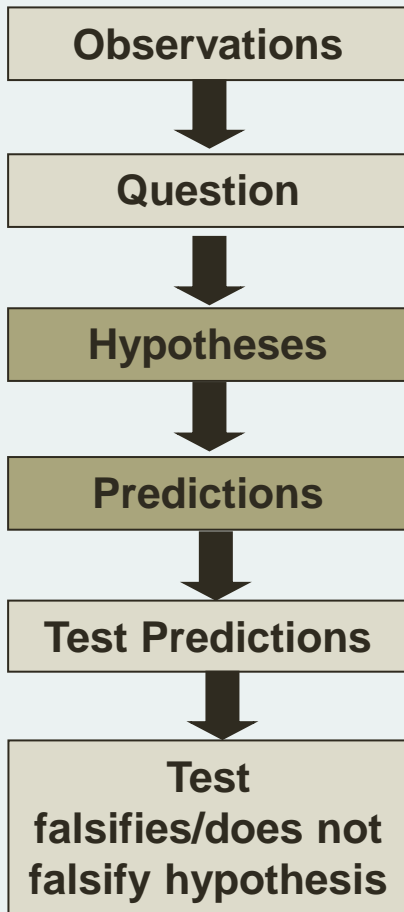

Other approaches:

Bacon and Newton advocate for 'inductive' approaches

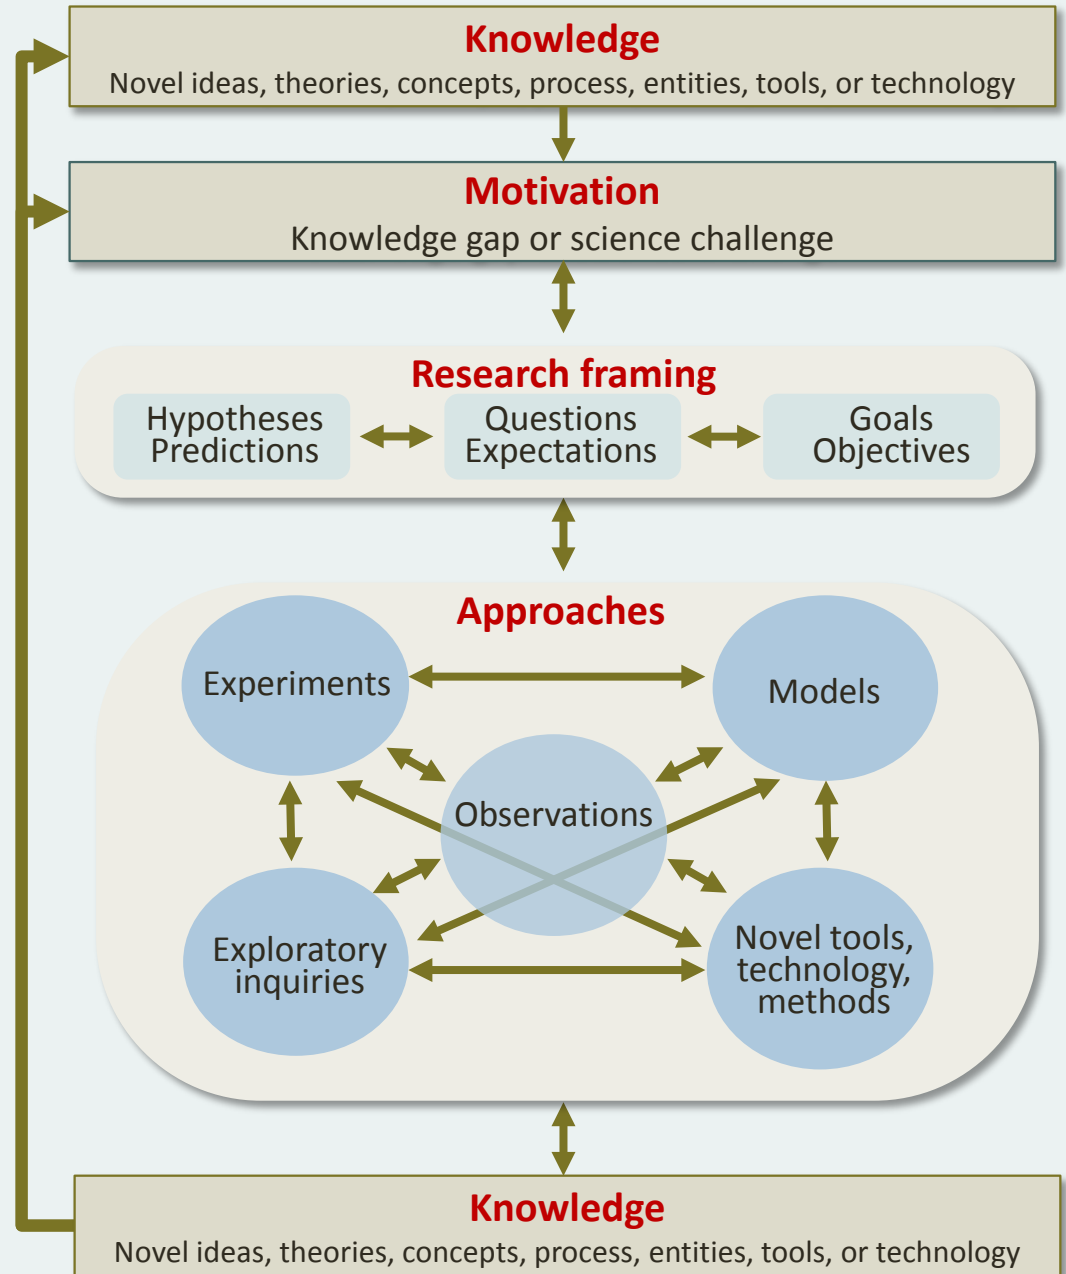

Rise of natural history

John Stuart Mill advocates for inductive approaches

Hypothesis-driven Research

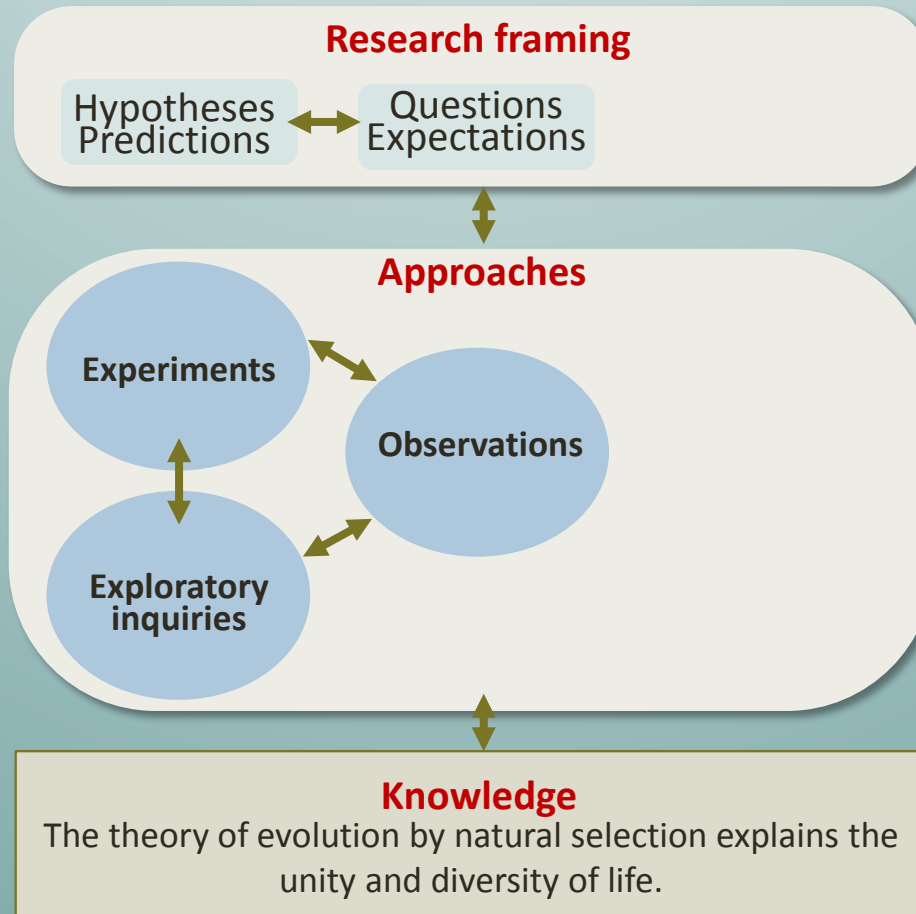

Iterative Research

EXAMPLE: The study of evolution by natural selection

* Darwin was 'forced' to conform to the scientific norms of the time, with strongly inductive arguments, but he did eventually arrive at successively more general causal laws.

Historical context of hypothesis-driven science

Hypothesis-driven approaches:

Boyle and Hooke advocate for hypothesis-driven approaches

Dominance of hypothesis-driven approach (e.g., Popper)

Criticisms of descriptive science

Today:

A combination of approaches and iteration between modes

Other approaches:

Bacon and Newton advocate for 'inductive' approaches

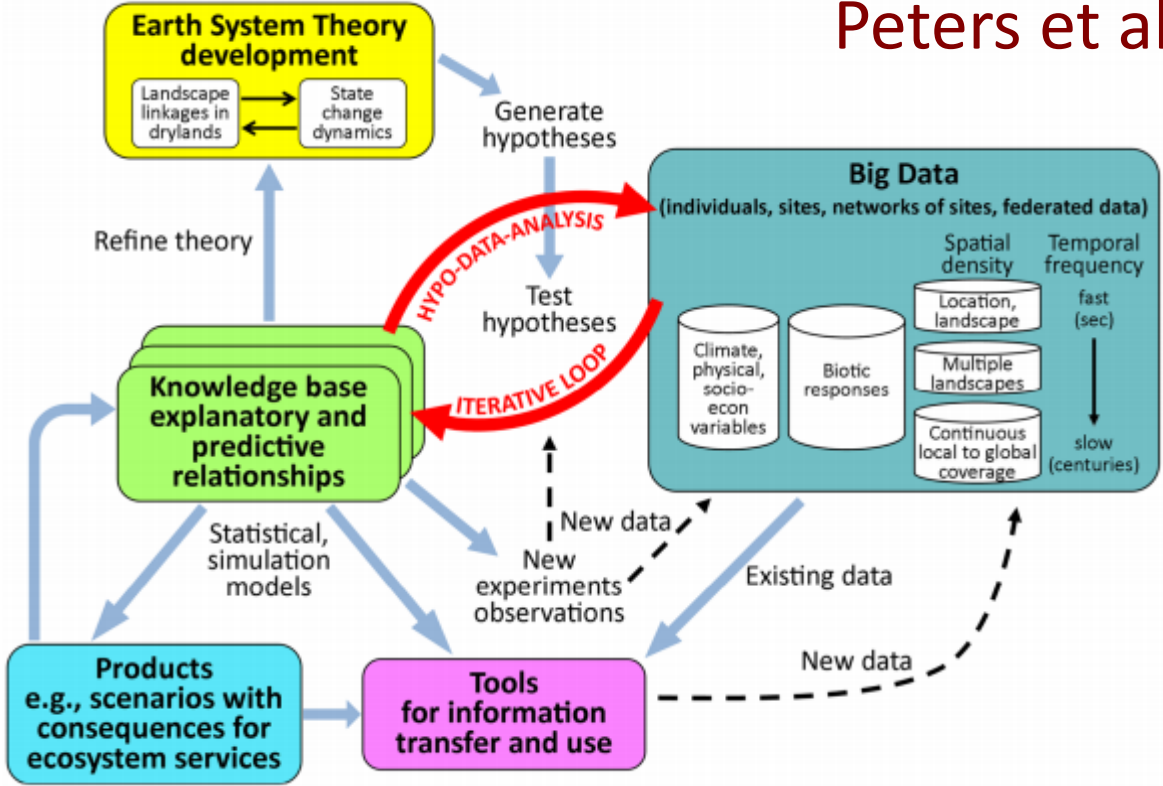

Rise of natural history

John Stuart Mill advocates for inductive approaches

Other examples recognizing the rise of data-intensive and iterative research:

Big Knowledge Learning and Analysis system (KLAS)

Peters et al. 2014

-- Focus on iteration between methods/tools, use of large datasets, hypotheses, theories

RECOMMENDATIONS: Data-intensive research

- **Replace the requirement of hypothesis-testing** (in articles & proposals) with evaluation of the **alignment between knowledge gap and approach & conclusions**
- **Publish (and value) the different components of the research cycle**
- **Teach the iterative mode of scientific practice at all levels of schooling**

The new norms are...

1. Science is increasingly conducted by teams
2. Data-intensive research is on the rise
- 3. Data sharing is needed for emerging research areas**

Why share research data?

- To reproduce research
- To make public assets available to the public
- To leverage investments in research
- To advance research and innovation

Christine Borgman
*Distinguished Professor &
Presidential Chair in
Information Science*

MIT Press, 2015

<https://works.bepress.com/borgman/390/>

Arguments FOR data sharing:

*“The Science family of journals is committed to the sharing of data relevant to **public health emergencies**, and therefore... we endorse the statement below”.*

- McNutt 2016

- **Journal content on the topics are open-access**
- **Require data sharing as rapidly and widely as possible**

Science, Editor-in-chief

Arguments FOR data sharing:

“Sharing data and crediting sources are among the most basic of scientific ethical principles.”

- Duke and Porter 2013

Director of Science Programs, ESA

Rsch Assoc. Prof., Univ. Virginia

Arguments FOR data sharing: *Ethical considerations*

Patricia
Soranno,
Ecologist

Kendra
Cheruvilil,
Ecologist

Kevin
Elliott,
Philosopher

Georgina
Montgomery,
Historian

Arguments FOR data sharing: *Ethical considerations*

The norms about data must better align with sciences' growing emphasis on **inclusion**

Implicit bias

Marcia McNutt

+ Author Affiliations

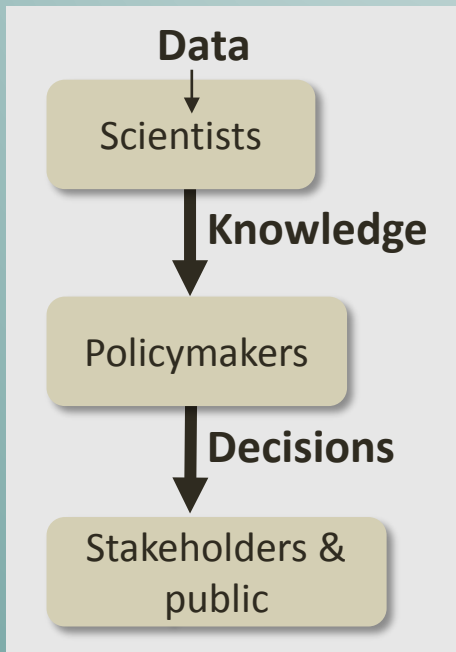

"...successful organizations and people welcome those who do not...act like they do."

Science 27 May 2016:

Arguments FOR data sharing: *Ethical considerations*

Data sharing is essential for ensuring successful efforts at the science-policy interface

Deficit-linear model

Round-table model

Arguments FOR data sharing: *Ethical considerations*

The combination of **public sponsorship of research**, **'inclusive' participation in research**, and **connection with policy** creates a set of circumstances that push environmental scientists—and particularly those who seek to broaden participation in science—toward data sharing as an ethical obligation.

- *Soranno et al. 2015*

Arguments FOR data (and other) sharing in **ECOLOGY**:

2005 - 2015

- Parr and Cummings 2005
- Zimmerman 2008
- Reichman, OJ et al. 2011
- Wolkovich et al. 2012
- Hampton et al. 2013
- Duke and Porter 2013
- Hampton et al. 2015
- Michener 2015
- Gries et al 2016

Open Science

Defined as science that has:

1. *Fully accessible publications*
2. *Fully accessible data*
3. *Transparent and reproducible methods*

Good blog by Michael Nielsen about open science:

<http://michaelnielsen.org/blog/the-future-of-science-2/>

Open-science practices

(1) Publishing: **Open Access** *journals & publishers*

Open-science practices

(2) Data: **Data repositories**

Open-science practices

(3) Data, continued: **Journal policies requiring public access to data**

Announcement: Where are the data?

07 September 2016

nature

International weekly journal of science

As the research community embraces data sharing, academic journals can do their bit to help. Starting this month, all research papers accepted for publication in *Nature* and an initial 12 other Nature titles will be required to include information on whether and how others can access the underlying data.

Open-science practices

(4) Transparency: **Data papers, methods papers, metadata, etc.**

Arguments AGAINST data sharing:

Some barriers that have been highlighted (Hampton et al. 2015)

- Time to adopt new practices, learn new tools
- High-stake issues for scientists -- *Precedence, attribution, investment, and payoff*
- Relinquishing control
- Mindset of 'data ownership'

Arguments AGAINST data sharing:

- Should **not** have a **‘blanket’ policy** because scientists should be using ‘proprietary’ data of the ‘data economy’:

*“Requiring data to be...open access may feel right but could have **perverse consequences** for the future of science.”*

- Fenichel and Skelly 2015

Yale Univ.

*F.R. Oastler Professor
of Ecology, Yale Univ.*

Arguments AGAINST data sharing:

- A global survey of 73 researchers engaged in long-term ecological and evolutionary studies.

*“Positive attitudes towards sharing data with agreement or involvement of the PI... only 8% were in favor of uncontrolled, open access to primary data.
AND,*

A more balanced viewpoint is necessary to allow a discussion to emerge on a code of ethics and ways to preserve and protect the data.

- Mills et al. 2015. Trends in Ecology and Evolution

Arguments AGAINST data sharing:

- Scientists should not be expected to share because they have **intimate knowledge of their systems**, and:

“There is also the emerging issue of a generation of what we term as ‘parasitic scientists’ who will never be motivated to go and gather data because it takes real effort and time and it is simply easier to use data gathered by others.”

- Lindenmayer and Likens 2013

Professor, Austr. Nat'l. Univ.

President of Cary Institute-Emeritus

Arguments AGAINST data sharing:

Scientists NOT involved in the study **cannot understand/know the choices the scientists made**; and:

*“There is concern among **some front-line researchers** that the system will be taken over by what some researchers have characterized as **“research parasites”**.”*

- Longo and Drazen 2016

NEJM & Harvard Med. School

NEJM, Editor-in-chief

Moving forward? The discussion is NOT over, so lets keep working

Christine Borgman
*Distinguished Professor &
Presidential Chair in
Information Science*

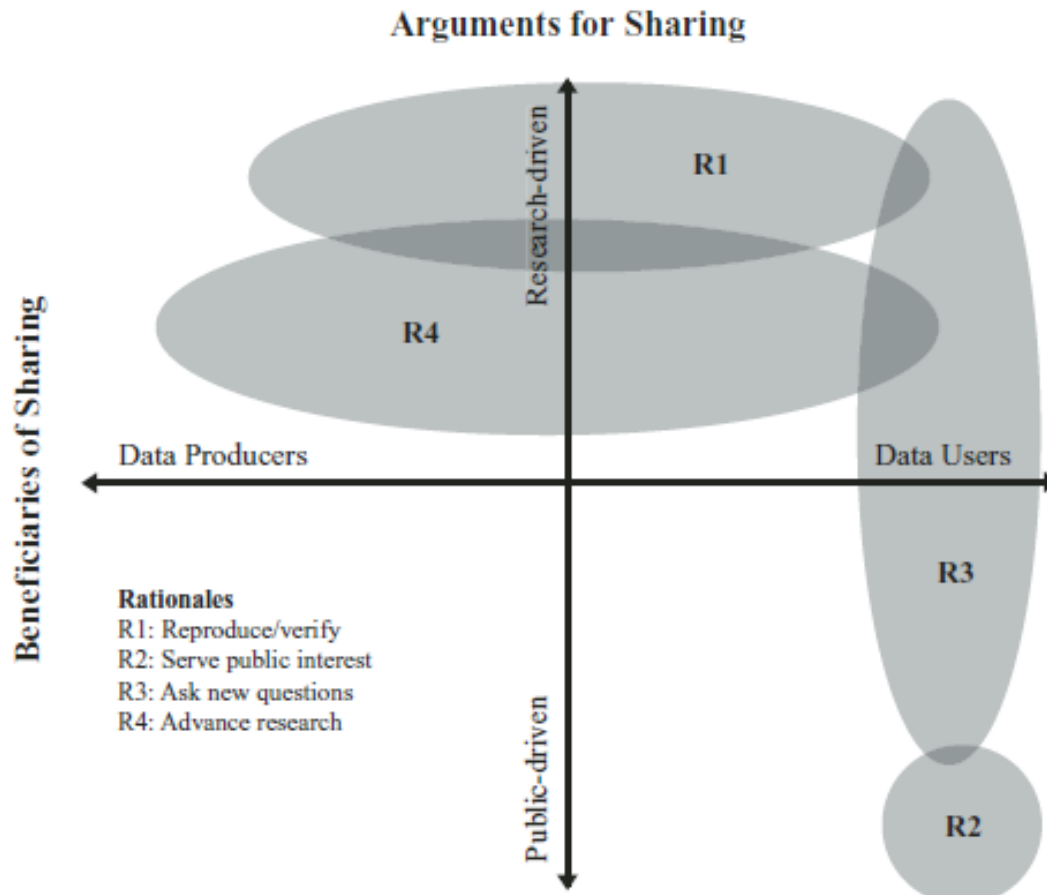

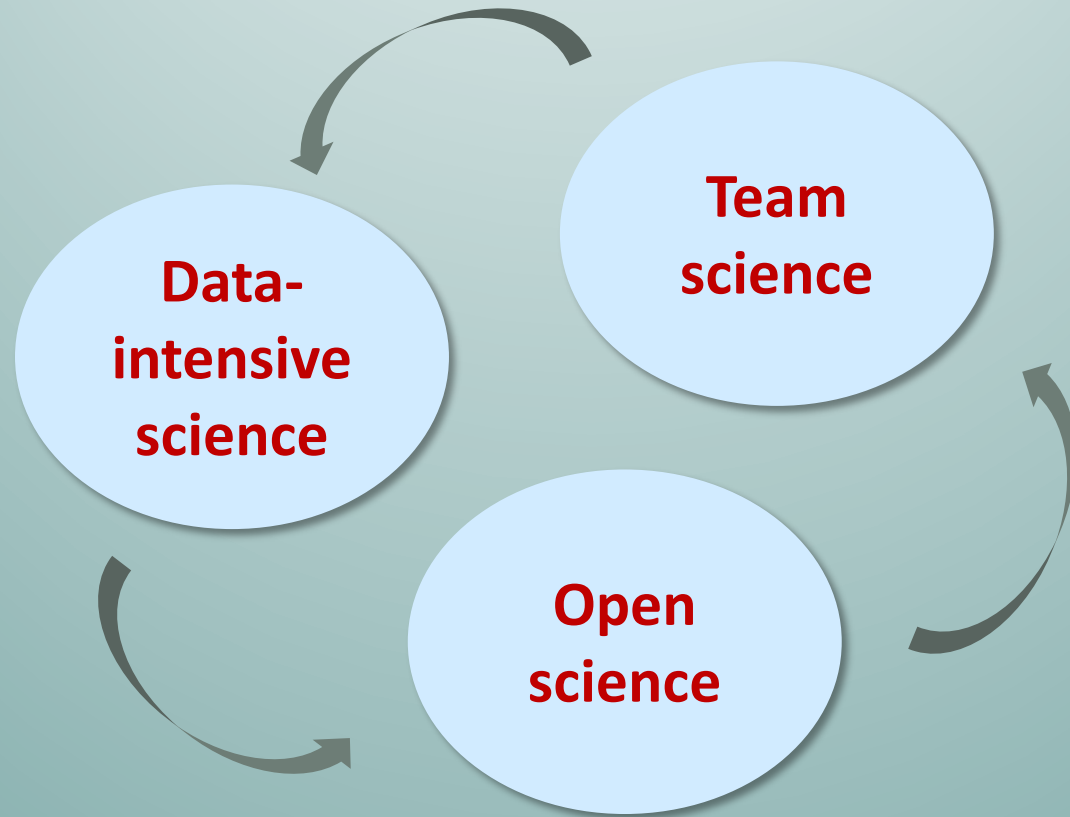

FIG. 3. Rationales for Sharing Research Data.

From: Borgman 2011. The conundrum of sharing research data

RECOMMENDATIONS: Data-sharing and open science

- 1) Provide **training and tools** for ALL scientists
- 2) Develop **incentives and rewards** for sharing
- 3) Change the **culture** of science from closed to open
- 4) Have more conversations about **what scientists' ethical obligations and roles in society** really are

Addressing many important challenges in ecology

But to incorporate these modes, will the culture get in the way?

Question for you

- Are we on the cusp of making data-inspired discoveries to answer societally-relevant and scientifically-interesting questions, in an inclusive manner?
- If so, are the efforts currently hampered by our the norms and culture in ecology?

VS
